

# Installing the ALD Assistant in Claude Code

Command-line (terminal) setup — about 5 minutes, one time.

**Before you start:** make sure Claude Code is up to date ( `claude --version` ), and have the **client ID** and **API key** we sent you to hand for the last step.

## 1 Install uv (one-time)

The plugin runs a small local helper that needs a free tool called `uv`. Install it for your system:

MACOS / LINUX

```
curl -LsSf https://astral.sh/uv/install.sh | sh
```

WINDOWS (POWERSHELL)

```
powershell -c "irm https://astral.sh/uv/install.ps1 | iex"
```

Open a **fresh terminal** afterwards so `uv` is on your `PATH`.

## 2 Add the marketplace

Start Claude Code ( `claude` ), then run:

```
/plugin marketplace add UNIVOCO-Ltd/claude-plugin-ald
```

## 3 Install & activate the plugin

```
/plugin install ald@ald-tools  
/reload-plugins
```

## 4 Authenticate (one-time)

Run the bundled command and paste your credentials when prompted:

```
/ald:authenticate
```

...or just type it as a message: *authenticate with client\_id <YOUR CLIENT ID> and api\_key <YOUR API KEY>*. It's validated and remembered, so you only do this once.

## 5 Use it

Ask ALD questions normally, for example: "How do I create a template in ALD?" The plugin's tools appear as `mcp__ald__*` and it answers from the ALD knowledge base.

**If it doesn't connect:** an error like `spawn uv ENOENT` means `uv` isn't on your `PATH` — reinstall `uv`, open a new terminal, and run `/reload-plugins`. Check the `/plugin` Errors tab for details.
