

Installing the ALD Assistant in Claude Desktop

Windows setup guide — about 5 minutes, one time.

Before you start: make sure **Claude Desktop is up to date**, and have the **client ID** and **API key** we sent you to hand — you'll need them at the last step.

1 Install uv (one-time)

The assistant runs a small local helper that needs a free tool called **uv**. Open **PowerShell** and paste this line:

```
powershell -c "irm https://astral.sh/uv/install.ps1 | iex"
```

Then **fully quit and reopen Claude Desktop** so it picks up the new tool. (*This restart matters — skipping it is the usual reason it won't connect.*)

2 Add the marketplace

In Claude Desktop: left sidebar → **Customize** → **Plugins** → **Add marketplace**, and enter:

```
UNIVOCO-Ltd/claude-plugin-ald
```

If it asks for a full link instead, use <https://github.com/UNIVOCO-Ltd/claude-plugin-ald>.

3 Install the plugin

Find **ALD Assistant** (**ald**) in the list and click **Install**.

4 Authenticate (one-time)

Open a normal chat and send this message, pasting in the credentials we gave you:

```
Authenticate to the ALD knowledge base with  
client_id <YOUR CLIENT ID> and api_key <YOUR API KEY>
```

Claude confirms once it's connected — it's remembered from then on, so you only do this once.

5 Use it

Ask ALD questions normally, for example: *"How do I create a template in ALD?"* The assistant answers from the ALD knowledge base.

If it doesn't connect: it almost always means **uv** wasn't installed yet, or Claude Desktop wasn't restarted after Step 1. Redo Step 1, fully quit and reopen Claude Desktop, and try again. Still stuck? Send us a screenshot of the Plugins screen.
